## Water Remediation Consulting Services

BioLynceus™ has over fourteen years of experience working with remediation of water and soils.

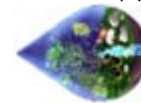

Some of the projects our services and products are successfully being utilized for include:

- ◆ home owner, association and private lakes and ponds
- ◆ fresh water lakes
- ◆ recreational lakes
- ◆ refinery & hydro-carbon lagoons
- ◆ municipal waste treatment lagoons
- ◆ golf course water features

BioLynceus™ utilizes proprietary systems for solving environmental challenges. All products are safe for use in water and will not kill or harm plants or animals including aquatic life.

See [www.BioLynceus.com](http://www.BioLynceus.com) for additional information and client testimonials.

# BioLynceus™ ProBiotic Scrubber Pond Solution

Returning water resources to natural and vital eco-systems is possible using beneficial systems provided by BioLynceus™ proprietary water remediation solutions.

*Changing weather conditions will erode the natural biology of water. Repopulation of naturally occurring microbes and digestive enzymes is required to return fresh water resources back to balanced environments.*

Repopulation of beneficial microbial and supporting nutrients helps return water resources to healthy, vital environments. Restoration of the water will help to reduce the need for toxic products to eliminate algae and other pathogenic elements.

## Benefits

- ◆ Increases microbial action
- ◆ Improves water quality & clarity
- ◆ Improves Ph balance
- ◆ Improves oxygen levels
- ◆ Remediates nutrients that cause algae
- ◆ Reduces odors
- ◆ Reduces biochemical oxygen demands
- ◆ Reduces sludge & total suspended solids
- ◆ Reduces ammonia levels
- ◆ Reduces nitrate and phosphate levels
- ◆ Reduces anaerobic layer

## Lake Treatments

Three lakes were being treated for excessive algae blooms. In the photos below the lake was being aerated with no impact on the algae bloom.

In the picture below the same lake was treated with ProBiotic Scrubber™ Pond Solution. The following picture was taken two weeks later. During treatment all of the treated lakes were successfully maintaining a healthy balance with no reoccurring algae or anaerobic conditions.

Meadow Lake (not shown) has been left untreated. Three years later Meadow Lake continues to have extreme algae blooms. The treated lakes continued to be algae free without anaerobic conditions.

## Product Information

Our biological products are 100% natural and earth friendly. When introduced into the natural environment they stimulate indigenous microbial, enhancing the biological process and accomplishing in days and months what would normally take nature years. Our products are live cultures which contain a composite of micro-organism, (aerobic, facultative and anaerobic) amino acids, nutrients and polysaccharides that are non-pathogenic and non-toxic. No re-hydrating or mixing is required. All products are shipped in liquid form. Most applications are premixed and easy to apply.

## Application Information

Our formulas integrate easily into the existing environment with minimal set-up. Site-review and recommendations for application are required to assure the correct system and application rates are established for each location. BioLynceus™ consultants provide periodic review of the system to assure quality and system controls are working correctly.

Please contact BioLynceus™ to discuss your water remediation project.
